Hospital.

\*\*\*\*\*

NOTICE

\*\*\*\*\*

In case anyone should be inter-

ested, the Review would like

them to know, that during the

life of the Little Theatre organi-

zation in Redcliff, which lasted

approximately 3 1/2 years, the Re-

view was paid \$50.25 for print-

ing done for said organization

(not approximately \$100), and

gave, free of charge, services

amounting to \$15.30.

\*\*\*\*\*

Furthermore, the Review

would like all to know that, at

the time the printing was done

for the Little Theatre, it was

announced absolutely satisfac-

tory, by Mr. W. King, and no

objection whatever was made by

him in regard to the prices

charged.

CHOOSING A SPOT FOR POCH'S MEMORIAL

## Millions Of Meteors Enter Earth's Atmosphere Daily According To Astronomers

A hundred million million meteors a day enter the earth's atmosphere, according to the astronomers. Luckily nearly all are mere grains which expire in momentary glory as they brush against the air. But a few match-heads flare up after striking a rough surface. The meteor that crashed near the village of Port, near the mouth of the St. Lawrence, was clearly of unusual size. Moreover, it behaved quite in accordance with the rules. That is, it exploded and scattered its fragments over the countryside, where farmers will pick them up for years to come.

What are these bodies that wander through space for millions of years only to end occasionally in a flash when they rush into the atmosphere of a planet? Perhaps that was a left over after the planets were made, like the bits of brick, left and plaster that strew a pavement before a new building. More likely the debris of comets that exploded. There is no doubt in the minds of astronomers that the disruption of the Hela, Tuttle and Temple comets resulted in the formation of millions of meteors through which we plow at regular seasons. Even existing comets, like Halley, leave behind their trains of iron and stone.

The meteor that started Western observers pointed clearly to one in which the earth might be in danger. In 1908 there fell in Siberia the famous Podkamennaya Tunguska meteorite with appalling results. Thousands of square miles of forest were scorched. Fifteen hundred rounder were killed. The Podkamennaya was damned by falling cliffs. Professor Harlow Shapley thinks this body must have been a comet. But the Russians are of the opinion that it had fallen not in a desolate region of the earth but in a populous Europe or America. Cities blasted out of existence, rivers flashing into steam, great bridges and machines melting like lead. It is little short of exaggeration the probable devastation.

There is only one consolation in this dismal picture. No shooting star is likely to demolish the earth. The big ones are too few; the smaller ones are too dense. Yet our planet has been fortunate. Considering that it has been pelted for some two or three billion years it is little short of miraculous that history records no major catastrophe traceable to a meteorite. —New York Times.

### Everyone Has Favorite Dish

**Yorkshireman Collecting Recipes To Aid London Hospital Fund**  
Queen Mary's favorite dish is rabbit pie. Herd. Fynn, master of English over Irish beef pie. George Brent goes for onion soup, while Ann Sheridan thinks Italian spaghetti is the best thing.  
All this may not make sense to you, but it makes sense to Mr. D. Siddall, a fast-talking Yorkshireman, who is collecting recipes of the great and the good. Mr. Siddall's current job is to raise \$200,000 for the London hospital, of which Queen Mary is honorary chairman, and the Marchioness of Cambridge is bringing out a cook-book whose profits will go to the hospital. Mr. Siddall is collecting recipes for the Marchioness.

Mr. Siddall has just been out in Hollywood collecting favorite recipes of movie stars. He says Deanna Durbin has promised to go to England next year to sing at a concert in Royal Albert Hall. The profits from the concert, estimated at \$30,000, will also go to the London hospital.  
Already, he said, the Marchioness of Cambridge has secured the favorite recipes of all the royal family and of all the famous chefs in Europe. Asked what the Marchioness's favorite recipe was, he said he didn't know, but he felt sure she had one.  
Mr. Siddall said it was hoped to present Queen Mary with \$1,750,000 on her birthday in 1918. This money will be used to rebuild the hospital.

### Not Sufficient Postage

**Many People Are Careless And Friends Have To Pay**  
There is a marked increase in the amount of mail which is not fully prepaid. This is particularly noticeable on postage stamps sent by people on vacation.  
The rate on postcards bearing a written message, postage for which is not prepaid, is charged double the deficiency.  
Be sure everything you mail is fully prepaid and avoid embarrassing your friends.

### History Being Repeated

**Twelve Over Danzig Has Been Experienced Several Times**  
The present population of Danzig is, of course, overwhelmingly German-speaking, but, as a recent article in the "New Telegraph"—a German-language weekly published in Poland and Paris—points out, the original population of Danzig was of Slavic origin—premaritime Polish.  
The first recorded mention of Danzig dates back to 997. At the beginning of the fourteenth century it fell under the domination of the Teutonic Knights, but from the year 1410 until 1793 Danzig was alternately a free city under Polish sovereignty and an independent state. At the time of the second partition of Poland it was incorporated in Prussia. For a short period—1806 to 1813—it was under French control. At the Congress of Vienna in 1815, Danzig was turned over once more to Prussia.

It is interesting to note that the citizens of Danzig were consistently friendly to Russia prior to the annexation. At the time of the first partition of Poland—1772—when Frederick the Great tried to acquire Danzig, the people of that city turned to Russia for protection. When, in 1806, Napoleon's troops marched into Danzig the people rose in armed resistance. Looking back on Germany's propaganda campaign against Czechoslovakia last year, it is curious to note that in a proclamation issued at the time of the annexation of Danzig by Prussia in 1793 the Prussian government used arguments about Danzig similar to those that the German government later directed against Czechoslovakia—namely, that the attitude of the people of Danzig was "unfriendly." It was persistently unfriendly and that Prussia felt obliged to take over Danzig in order to insure the security and peace of the neighboring Prussian provinces.

The first thirteen years of Prussian occupation of Danzig apparently did little to make the people of that city more friendly toward Germany, for in 1820 Danzig was established as a free state. When the map of Europe was being redrawn at the Congress of Vienna in 1815, Danzig sent a deputation to the Vienna instructions to the Prussian government that city once more was in Prussia.

It does not follow, of course, that the people of Danzig to-day would be opposed to incorporation in Nazi Germany. Undoubtedly they have been subjected to a strong Prussian propaganda. But it is pertinent to bear in mind the fact that when in 1820 Danzig was established as a free state this was a reversion to the position which that city had enjoyed prior to its century of incorporation in Prussia and Germany. And while the problems of the west continue to be problems it is hardly likely that the part William Motherwell played in them will be forgotten, for in the beginning he was the spokesman of the farmers' movement for better marketing conditions which has now run far beyond him. He is part of prairie history—Vancouver Province.

### Reasonable To Expect

**That Canada's Population Will Grow As Resurgence Are Decried**  
The small time, Harry Star says: In 1861, when the first real census of England and Wales was taken, there was a population of 9,187,176. Thus England had a smaller population than Canada's present eleven million when it was engaged in the titanic struggle with Napoleon.  
One hundred years before that time it was estimated that the population was 5,000,000. To-day it is about 40,000,000, a tremendous increase having come with the expansion of the industrial age.  
It would seem reasonable to expect that as science and industry continue to expand and as the resources of the Dominion are developed, the population of Canada should likewise grow in the next few years.

**Great Tourist Attractions Among Canada's Greatest**  
Among Canada's greatest tourist attractions are the national parks. The regions are of outstanding scenic beauty or interest which have been set aside by statute for the use and enjoyment of the people. The parks cover a total area of more than 12,000 square miles.  
Dripping water in time will mark a new and regular Atlantic flight should help to educate American motorists.  
Borneo's glass catch is as transparent as glass.

A rough model of the statue of Marshal Poché which has been erected on the Esplanade du Trocadere in Paris so that a committee of architects and military authorities can judge from it the position of the finished statue.

### A Western Pioneer

**The Story Of William Motherwell Is The Story Of The Prairie West**  
A tremendous amount of water has flowed under the bridges of the country and not a few bridges have been built over the country's water since the day in 1882 when young William Motherwell, newly-arrived from Ontario, unloaded his plow from his cart in the beautiful Qu'Appelle valley and started breaking the prairie sod.

Canada was only 15 years old then; she is past 70 now. The second world war, however, has not translocated the railways were still un-built. There was no railway debt or war debt or income tax in the country. The great west was unorganized and there were few settlers west of the Red River settlement. It was years before the country was established on a wheat economy. It was to be years more before that economy collapsed.

Young William Motherwell went west to be a farmer, and farming, business and farm problems have been with him day and night ever since. They brought him into farm organizations; they brought him into politics. They gave him seats in two cabinets. They still worry him and though he announced to a gathering at Assembly this week that he had decided to retire, no one believes the restless William Motherwell can ever do that. In harness or out, he will find some way of pulling a little more than his share.

The story of William Motherwell is the story of the prairie west. And while the problems of the west continue to be problems it is hardly likely that the part William Motherwell played in them will be forgotten, for in the beginning he was the spokesman of the farmers' movement for better marketing conditions which has now run far beyond him. He is part of prairie history—Vancouver Province.

The papyrus plant, once so useful to Egypt, no longer grows there. The holy tree is one of the oldest groves of trees in the world.

## Even A Beginner Can Knit These

**PATTERN 6411**  
Knitting with two strands of strong wool the making of these 10-inch squares that even a beginner will show with pride. Keep one of these easy squares at hand to fill old moments—you'll be surprised how many you'll get done. Before long you'll have enough to join into a lovely hand-knit bedspread or scarf. Pattern 6411 contains instructions for making the square illustration of 8 and 10 inches; material needed; photographs of the finished squares.  
Obtain this pattern and 20 cents in stamps cannot be accepted. To Household Art Department, Winnipeg Newspaper Union, 170 McDermott Ave. E., Winnipeg.  
There is an Alice Brooks pattern book published

## Amount Of Rainfall Needed To Produce A Normal Crop In The Western Provinces

"We had an inch of rain last night."

Yes, indeed, it was a nice rain but just how many of us know what an inch of rain really is and know of its true value. When the grain is "tilling" at a dry time an inch of rain may make all the difference between 10 bushels per acre of grade one wheat, or 20 bushels per acre of No. 1.

But, really what is an inch of rain and how can it be measured? An inch of rain is enough to leave an inch of rain water on any level surface where none sinks in or runs off, and none is added from a roof, etc. Under average conditions, an inch of rain will soak down about the top six inches of soil, but 10 rains of one-tenth of an inch each may not be of any real value. For, if a rain does not soak far enough into the soil to connect with the moisture below, it won't last long when the sun comes out.

With a little care, anyone can measure rainfall fairly accurately. If you will get an open top water-tight can with straight sides on top of a post in the open, then measure the water in the can after every rain, you'll have a pretty good gauge of the rainfall. A standard government rain gauge is made in the shape of a funnel with straight sides and a small hole in the bottom. This is set above a glass container; get in another can. The water is drained from this glass into a glass measure of one-tenth of an inch. The measure is marked in inches and tenths, giving easy and accurate readings of rainfall in tenths and hundredths. In fact, the government rain gauge is reported as decimal two five or .25. A half-inch would be .50 and so on.

At your house is size 22x20 an inch of rain will amount to over two tons, or in other words, if your average trough is long and wide, you'll get more than nine barrels full of wet water.

At least four to five inches of rainfall to produce a crop on average land. And, as well, it must be fairly good. For, as well as producing a crop of wheat, most fields now grow a crop of weeds, too. These also take a great deal of moisture.

Through most of the western plains the subsoil can be considered dry to the depth of our soils. As rain falls, it soaks into the land which supports plant growth, such as grass, clover or weeds. However, if we kill this growth by summer-fall, some of this moisture will be stored in our land. Thus the past winter fallow summer and poor years follow years of abundant harvest. In good years much every effort to store up more food for man and beast.

And in dry years don't give up all hope. Since it ever has in the past. The country isn't through; it has only just begun.—Calgary Herald.

### Huge Telescope

**Will Peer Into Space Much Farther Than Any Instrument Now In Use**  
Paleontologists technicians are grinding and shaping the 200-inch "eye" which will peer two or three times farther into space than the largest telescope now in use.

It may answer astronomy's big question: Is the universe stationary, or is it expanding at an explosively destructive rate?  
No glass so large as this 20-inch mirror ever was cast before. In many other ways Palomar Observatory is a new venture and technicians are determined no serious mistakes shall be made.

Shaping of the glass began three years ago. For every pound of the nearly five tons ground from it, two pounds of abrasive have been used. When technicians enter the optical shop, insulated with four inches of cork to keep it at an even temperature, they remove bats and coats and change their shoes as an precaution against bringing damaging particles into the room.

### Both Had Same Idea

Arthur de Meire, restaurant owner at Milwaukee, was rushed for this one: A party of four stopped in to dine. Presently another quartet arrived. A woman in the second group looked over the first and exclaimed: "Why, George!" It developed that party No. 1 was on route from Minneapolis to Detroit to visit party No. 2 and vice versa.

The eighth wonder of the world: "Wonder how the neighbors can buy so many things we can't afford."

ply dry to a depth of at least four feet.

In irrigation we consider that it takes six inches of water for each acre of rain water. And we know of the acre foot of water per acre. This six inches will soak down from four to six feet in average soils, which has been found to be about as far as most plants can readily draw it. So that puts good summer irrigation on a year of average rainfall about equal to land with one irrigation.

But suppose that our summer-fallow has little rainfall on it. If we irrigate our field with six inches of water to start with and another six inches in midsummer, then it puts that field equal to well-watered summerfallow that receives good rains in the growing season as well. In other words, two irrigations can give a really good crop in even a dry year whereas it takes two fairly good years to produce one good crop on dry land.

Along about February we are likely to have a good level of soil. It may be calm and fall for about 30 hours. Then a lot of people will smile and say, "Look at that! That's a real winter. It's a real winter this year." But will we? Not always. For did you know, it takes a foot of rain to make an inch of moisture? If you don't believe me, just fill a straight-sided pan, like a honey can, with soft snow and set it on the kitchen stove. You may be amazed and dismayed at the small amount of water you get.

It is even less than this inch of the land receives, for if there is any moisture in the soil from the previous fall, the ground will resist frost and unable to take the water in. Usually before the snow melts some big wind storms will make an inch of rain water into a foot of snow. As it melts, most of it flows over frozen ground until it finds its way into the cracks and crevices, where it is of very little value to growing crops.

Even the only time that the snow is of much value is following a very dry fall. Then if we have early snow and rain, the snow will melt and run off and if the snow is of a good depth and melts slowly much of it may fall into the land to be of use.

It is very interesting to keep rainfall records or look carefully at the records kept by others. Then one can plainly see that years of drought and years of abundant rainfall follow in cycles. Every one of us, both in the west and in the east, should remember this, especially in times of abundance. For, just as surely as dark, stormy, dreary, and poor years follow years of abundant harvest. In good years much every effort to store up more food for man and beast.

And in dry years don't give up all hope. Since it ever has in the past. The country isn't through; it has only just begun.—Calgary Herald.

### Return To Normalcy

**West Can Produce As Generously As It Has In The Past**  
The crop loss here, the hay is abundant; the elevator companies are planning to enlarge elevator capacity which was increased only a year ago.

Price is, after all, a fluctuating item. Some years, it is up other years, down. Australia and the Argentine, insect pests, war scares—all these factors influence it. The important thing is the fertility of this province—the whole Canadian west.

And this important point has been established. The west can produce food for men and animals just as generously as it ever has in the past. The country isn't through; it has only just begun.—Calgary Herald.

### Progress Cause For Pride

**England Erecting 1,000 Houses Weekly In Slum Clearance**

England has started the construction of its fifth million of new homes in a slum clearance program that began with the end of the World War. The completion of the 4,000,000 new homes program is expected for considerable relief. The program is being carried out with construction of about 1,000 houses a week. Since the Argentine government and municipal grants have totalled \$2,000,000. Besides the new construction Britain is also engaged in a program of modernization of old premises. Sensible England is carefully planning to make sure it is such a source of real progress, says the Boston Post.
